Hu Meishi

In this course, I experienced the whole process of designing, developing, testing and promoting a new website. I know that making other products should be just as hard or even harder. Those 5 facets of user experience will always be considered when designing a product. Then, usability test helps me know about the user experience well and tell what should be improved. Finally, the qualitative and quantitative tracking of traffic and user behavior also play a significant role in product improvement. Each step is critical to the successful development of the product. In the future, I will constantly improve my website to help more target users solve their problems.

Due to my own reasons, I didn't allocate enough time to different things when many things were coming up at the same time, so I couldn't submit the web project on time.

When learning this course, the teacher paid great attention to- it, and I also found many points related to web design very interesting. When I was in class, I thought that I must spend time to learn after classes. I may turn web front-end design into a skill for me.

However, later, facing different tasks when the deadline was approaching, I failed to deal with the allocation of time. Anyway, these are all my own excuses, and they are not the reason for me to hand in my homework late. In the following courses, I will hand in my homework on time, allocate time according to different priorities, and strive to do everything in an orderly way.

Apart from the allocation of time, self-study is very important in school. Privately, at the end of the school course of study, I should have work hard to study the content of the web design.

In the future study, I will allocate different tasks well and finish them on time. Also, learning after class will not be reduced.
